# Math 168: Homework Assignment 1 

William Stein

Due: Wednesday, Oct 5, 2005

The problems have equal point value, and multi-part problems are of the same value. You are allowed to use a computer on any problem, as long as you include the exact code used to solve the problem with your solution. Any software systems (e.g., Magma, SAGE, Mathematica, C) are allowed.

## 1 Announcements

1. Homework will typically be assigned on Mondays and due on the following Wednesday. Then you have plenty of time to ask me questions about it.
2. Grading: For undergrads it is exactly as on the syllabus. For graduate students, make some effort on the homework and do a final project and you will get an A. I will greatly appreciate if grad students help the undergraduates in the course.

## 2 Problems

1. Prove that there are infinitely pairs $(x, y)$ of rational numbers such that $3 x^{2}+4 y^{2}=7$.
2. Find (by brute force) all pairs $(x, y)$ of integers with $0 \leq x<5$ and $0 \leq y<5$ and

$$
y^{2} \equiv x^{3}-x \quad(\bmod 5)
$$

3. Find an elliptic curve $E$ over a finite field $\mathbb{F}_{p}$ such that the group $E\left(\mathbb{F}_{p}\right)$ is not cyclic.
4. I'm giving you an account on my "super-fast" dual-opteron server modular.ucsd.edu, where you'll be able to run SAGE and Magma. Please select a login name. See also http://modular .ucsd.edu/calc/.
5. Find 10 distinct solutions $(x, y)$, with $x, y \in \mathbb{Q}$ to the equation

$$
y^{2}+y=x^{3}-7 x+6 .
$$
